The image is split vertically. The left side shows a close-up of a woman's face wearing black smart glasses. A small yellow circle is visible on the left lens. The right side shows a grayscale, slightly blurred image of a person's face, likely representing the data being processed by the glasses.

Your camera-equipped glasses capture every oncoming face, transmit the images for recognition, Google the names, and flash results in your lens. Is the person who just stepped into your elevator a celebrity? Pickpocket? Potential client? Available? With the glasses, you know.

Of course, once you begin wearing them everyone else will too.

Do you engage Autopilot knowing that a machine capable of calculating pi to 31 trillion digits did not even slow down when it passed underneath, with the trailer-bottom shearing off the top of the Tesla Model S?

If it works better when she believes a human is on the other end, do you tell her?

“Woebot feels more like a friend than an app.”

The tech behind it all

Technically speaking, Woebot is an AI-powered, personalized emotional support platform that detects users' symptoms and delivers clinically-validated psychological interventions to achieve better outcomes. But for countless users, Woebot is so much more.

Woebot helps people cope with life's challenges by using brief conversations to ask people how they're feeling and what is going on in their lives, then delivers useful tools that are right for the mood and the moment. People can use Woebot on their own or in conjunction with traditional talk or medical therapy to get reliable and compassionate support, right when they need it most.

^c Center for Medical Ethics, Faculty of Medicine, University of Oslo, Norway

In response to these problems, public committees and expert groups, research institutions and private companies have in recent years issued reports on and guidelines for responsible use of AI. A systematic review of the corpus of such guidelines found 84 documents containing ethical principles and guidelines for the use of AI [11]. The review identifies a significant global convergence on the importance of, among others, the transparency or explainability of AI decision-making. The review also finds, however, a significant variance in the posited features of transparency. Thus, for instance, transparency is posited to 1) serve very

Although social networking generally requires using one's real identity, half of our interviewees reported using fictitious profiles to go on social networking or dating sites, or used false personal information when chatting online. Some interviewees used different social network profiles to separate the information they shared with different groups of people. A teacher (#17) was very active in a fandom group, and often posted fan fiction online. She wanted to keep in touch with other members of that community, but she was afraid that she might be criticized if her family or her boss found out about her writing because it was not "real" fiction. She therefore maintained two Facebook accounts, one under her real name for family and co-workers and one under a fictitious name for fandom friends.

Performance	+1
Safety	N/M
Accountability	N/M

Investors could pressure for answers to get better long term prediction of company value (How users will respond to the product)

SAFETY/ACCOUNTABILITY

APPLY (TESLA)

TESLA

...first known fatality in just over 130 million miles where Autopilot was activated. Among all vehicles in the US, there is a fatality every 94 million miles. Worldwide, there is a fatality approximately every 60 million miles.

SAFETY

Is safety about *risk*, weighing the odds, the known unknown?

(1 fatal outcome in every 130m Autopilot miles versus 1 in 94m human miles)

Or, is it the unknown unknown...

(1 fatal outcome for a reason that cannot be imagined, at a time that cannot be foreseen)

- The problem of explainability

ACCOUNTABILITY

If a car is trained to drive on data, and then continuously trained on the driver's own habits (acceleration, turning radius, and so on), and then there is an accident, who is to blame? The original data, the software designer, the AI, the human driver?
